

PARTNERSHIP MEMORANDUM

Prepared for: Mercado Bitcoin
Subject: Asset Tokenization & On-Chain Credit
Date: May 7, 2026

1. Executive Summary

Vaulx is a protocol designed to connect asset-rich borrowers in emerging markets with global on-chain liquidity, utilizing high-end physical luxury assets (e.g., luxury watches) as collateral. We propose a strategic partnership wherein Mercado Bitcoin (MB) acts as the licensed entity to tokenize these physical assets, bringing compliant, high-yield Real World Assets (RWAs) to MB's existing infrastructure and institutional network.

2. The Brazilian Credit Asymmetry

Despite possessing highly liquid, globally valued physical assets, Brazilian borrowers are subject to highly punitive credit rails. Traditional institutions either severely under-lend or over-charge:

Traditional Options		The Vaulx Solution	
Installments (Crediário)	200%+ APR	Target APR	24% APR
Consumer Loans	60%+ APR	Loan-to-Value (LTV)	Up to 50%
Caixa Penhor (Formal Pawn)	~30% APR Limited to 20% LTV (scrap value)	By bridging physical assets to global on-chain USDC capital, Vaulx undercuts local rates while offering 2.5x more capital per asset.	

3. The Tokenization & Credit Mechanism

To offer these competitive rates, we completely bypass traditional credit intermediaries by securely linking physical assets directly to global on-chain liquidity. The business logic operates through a trust-minimized workflow:

- 

1. CUSTODIAN VAULTING

The physical luxury asset is independently appraised and physically locked in a secure, licensed custodian vault. The custodian issues an immutable confirmation of receipt.
- 

2. ASSET TOKENIZATION (CNFT)

Triggered by the vault confirmation, the asset's legal rights are tokenized. A Compressed NFT (cNFT) is minted on the Solana blockchain, acting as the digital representation of the vaulted item.
- 

3. ON-CHAIN COLLATERALIZATION

The cNFT is locked into the Vaulx smart contract protocol, acting as verifiable, over-collateralized backing for the borrower's requested credit.

4. BORROWING FROM SOLANA LPS

Against the secured cNFT collateral, USDC is programmatically drawn from on-chain Liquidity Pools (LPs) and instantly disbursed to the borrower via local fiat rails.

4. Role of Mercado Bitcoin (Tokenization Partner)

Vaulx has engineered the physical and smart-contract infrastructure. To operate compliantly and at scale, the protocol requires a regulated institution to issue the tokenized representations of the vaulted assets. We propose MB fulfills this critical role:

- ☒ **Regulated Issuance:** MB utilizes its existing licenses to mint the on-chain representation (cNFT/Token) of the physical luxury asset once Vaulx's licensed custodians confirm secure vaulting.
- ☒ **Capital Rails:** MB can act as the primary fiat-to-stablecoin ramp for borrowers, seamlessly converting disbursed on-chain capital (USDC) into Reais (BRL) via PIX.
- ☒ **Distribution to MB Clients:** The resulting over-collateralized lending pools can be offered as premium, fixed-yield RWA products directly to MB's institutional and retail investor base.

5. Operating Architecture

VAULX RESPONSIBILITIES	MERCADO BITCOIN RESPONSIBILITIES
• Borrower acquisition & onboarding UX. • Coordination of 3rd-party independent appraisals. • Management of licensed, insured physical custody (e.g., Brinks/Loomis class). • Maintenance of the core smart-contract lending protocol (Anchor/Solana).	• Legal framework for asset tokenization. • Minting of compliant on-chain asset records. • Fiat on/off ramping for borrower disbursement. • (Optional) Supplying capital to senior lending tranches via MB client yield products.
